Human heat shock protein 70

24-OCT-1997 (first entry)

AAW10065;

```
The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the Arpase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Sequence

ö

This sequence represents the human heat shock protein HSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome. Sequence 640 AA;

I identifying mutant peptides from heat-shock protein 70, for treatment of cancer -

RESULT ŏ g This peptide corresponds to amino acid residues 286-294 of the human heat shock protein 70 (hsp70). The invention relates to a method of identifying peptides, darived from hsp70 that stimulate a tumour-specific T cell response. Identification of the hsp70 peptides that have at least one mutation or alteration compared with the native sequence, and induce a tumour-specific T-cell response, comprises: (i) amplifying hsp70 encoding DNA from one or more tumours; (ii) cloning the amplifying hsp70 encoding DNA from one or more tumours; (ii) cloning the amplifying hsp70 encoding pNA from one or more tumours; (ii) cloning the amplifying hsp70 encoding pNA from one or more tumours; (iii) sequencing fragments in each cultured bacterial colony to identify can pyp70 mutant peptides identified. The peptides, optionally formulated with an agent that induces cellular stress, are used for treatment of cancer, particularly solid cancers (carcinoma, sarcoma, melanoma, neuroblastoma, cancers of head and neck, particularly widney cancer). The peptides may also be used to increase the proportion of tumour-specific cytotoxic T lymphocytes in a cell culture and/or induce these cells to secrete tumour necrosis factor), particularly where the cells are used to tumour necrosis factor), particularly where the cells are used to timnunde immune defences. The method identifies peptides with high immunogenicity and high specificity for particular HLA (human leucocyte ö HSP; HSP70; heat shock protein 70; cancer; chronic infectious disease; vaccine; HSP-peptide complex; tumour; peptidic fragment; lymphocyte; cytotoxic response; epitope; antigen presenting cell; fragment 1. ```
to lymphocytes which recognise cells of a patient in which overexpression of HSP heads to a substantial cof HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increase allicits a cytotoxic pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSPVO epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to specific cells, (e.g. cancer cells). HSPVO fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or intracellular infected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This peptide corresponds to amino acid residues 286-295 of the human heat shock protein 70 (hsp70). The invention relates to a method of identifying peptides, derived from hsp70 that stimulate a tumour-specific T cell response. Identification of the hsp70 peptides that have at least one mutation or alteration compared with the native sequence, and induce a tumour-specific T-cell response, comprises: (i) amplifying hsp70 encoding DNA from one or more tumours; (ii) cloning the amplified sequences into a vector that can be replicated in bacteria; (iii) sequencing fragments in each cultured bacterial colony to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; heat shock protein 70; hsp70; identification; tumour; mutation; T cell response; amplification; vector; bacterium; cancer; allele; cytotoxic factor; interleukin; interferon; tumour necrosis factor; HLA; immune defence; immunogenicity; specificity; human leucocyte antigen.

any hsp70 mutations, and (iv) determining the immunogenicity of the mutant peptides identified. The peptides, optionally formulated with an agent that induces cellular stress, are used for treatment of cancer, particularly solid cancers (carcinoma, sarcoma, melanoma, neuroblastoma, cancers of head and neck, particularly kidney cancer). The peptides may also be used to increase the proportion of tumour-specific cytotoxic T ymphocytes in a cell culture and/or induce these cells to secrete cytotoxic factors (specifically interleuwin-2, interferon-gamma and tumour necrosis factor), particularly where the cells are used to stimulate immune defences. The method identifies peptides with high farminogenicity and high specificity for particular HLA (human leucocyte

Lymphocytes useful for treating cancer, recognizes specifically transformed human cells with induced and increased membrane expression of heat shock protein -Claim 8; Page 15; 21pp; English.

The amino acid sequence of fragment 2 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to 1 ymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to Specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or

The amino acid sequence of fragment 3 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP heads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which Kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or intracellular infected cells. 10 AA;

Lymphocytes useful for treating cancer, recognizes specifically transformed human cells with induced and increased membrane expression

Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application

```
This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The apnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; heat shock protein; HSP70; chromosome 6p21.3-22; stress; chromosome 14q22-24; transcription; rheumatism; schizophrenia; depression; nephrotic syndrome; SHSP70.

The invention relates to a novel method of identifying compounds that inhibit proliferation of cells comprising contacting a test compound with a cell which overexpresses HSP72 (heat shock protein 72), and determining if the test compound inhibits activity or expression of HSP72.

Optionally, HSP72 is contacted with the test compound under optimum conditions to allow the two components to interact and bind, forming a comparation, comprising contacting a test compound with a cell which expresses HSP72, exposing the cell to a heat induced stress and cettracting if the compound inhibits JNK phosphatase activity. The invention additionally encompasses compositions comprising an inhibitor of HSP72 or JNK phosphatase activity. The compounds identified as invention additionally encompasses compositions comprising an inhibitor of HSP72 or JNK phosphatase activity. The compounds identified as inhibitors of HSP72 or JNK phosphatase activity are useful for on thibitors of HSP72 or JNK phosphatase activity are useful for inhibitors of HSP72 or JNK phosphatase activity are useful for as cancers (e.g., leukaenia, lymphoma, solid tumours such as sarcomas and carcinomas, breast cancer, prostate cancer). The compounds that inhibit the HSP72 activity can also be administered to treat premalignant conditions and to prevent progression to a neophastic or malignant state. The compounds that inhibit HSP72 function are administered to a patient condition and alsease or disorder mediated by an increase of HSP72 expression or activity relative to normal levels. The present sequence represents thuman HSP72 used in the exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human Hsp72; heat shock protein 72; chromosome 6p21.3; Hsp72 inhibitor; expression modulator; JNK phosphatase inhibitor; antiproliferative; drug screening; cancer; leukaemia; lymphoma; solid tumour; sarcoma; carcinoma; breast cancer; prostate cancer; premalignant condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying compounds that inhibit proliferation of cells and capable of modulating the expression of heat shock protein 72 gene and/or activity of Hsp72 useful for treating cancers such as leukemia,

                                                                                                                                                                                              sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSPOMRNA under acute and chronic stress load in a human. The abnormal transcription of HSPO can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6p21.3-22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                           This sequence represents the human heat shock protein SHSP70 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the human heat shock protein SHSP70 amino acid
                  Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application

In present investigation with the properties of the present investigation of the properties of the protein containing the ATPase domain of a heat cytotoxic T cells and a protein containing the ATPase domain of a heat as brock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the protein vector of (3). (1) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence respresents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                            Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer
                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a fused protein (I) prepared from a

This sequence represents the human heat shock protein HSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 1462-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome. Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application Claim 2; Fig 1; 11pp; Japanese. 640 AA; Sequence

Identifying mutant peptides from heat-shock protein 70, for treatment

WPI; 2000-013251/01.

of cancer

```
This peptide corresponds to amino acid residues 286-295 of the human clear shock protein 70 (hsp70). The invention relates to a method of clentifying peptides, derived from hsp70 that stimulate a tumour-specific T cell response. Identification of the hsp70 peptides that have at least a tumour-specific T-cell response, comprises: (i) amplifying hsp70 cone mutation or alteration compared with the native sequence, and induce coding DNA from one or more tumours; (ii) cloning the amplified coding DNA from one or more tumours; (ii) cloning the amplified coding DNA from one or more tumours; (ii) cloning the amplified coding DNA from ovector that can be replicated in bacterial.

CC (iii) sequencing fragments in each cultured bacterial colony to identify mutant peptides identified. The peptides, optionally formulated with an expensive that induces cellular stress, are used for treatment of cancer. Cancers of head and neck, particularly kidney cancer. The peptides may concers of head and neck, particularly kidney cancer. The peptides may concers of bead eto increase the proportion of tumour specific cytotoxic cytotoxic factors (specifically interleukin-2, interferon-gamma and cytimmulate immune defences. The method identifies peptides with high antiment allows allowed the antiment letter concerns the antiment of antiment letter consist factors (specifically for particular HLA (human leucocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HSP; HSP70; heat shock protein 70; cancer; chronic infectious disease; vaccine; HSP-peptide complex; tumour; peptidic fragment; lymphocyte; cytotoxic response; epitope; antigen presenting cell; fragment 2.

Lymphocytes useful for treating cancer, recognizes specifically transformed human cells with induced and increased membrane expression of heat shock protein -

The amino acid sequence of fragment 2 relating to position 286-295 of

```
buman heat shock protein 70 (HSP70) is given. The new invention relates to thuman heat shock protein 70 (HSP70) is given. The new invention relates of HSP has been induced. Overexpression of HSP leads to a substantial forchase in the numbers of HSPs and HSP epitopes presented on the numbers of HSPs and HSP epitopes presented on the pericellular membranes by lymphocytes elicits a cytotoxic on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the presenting cells. This has the effect of increasing the immune response to HSP70 epitopes are mutated prior to being loaded into antigen to HSP and helps direct the immune response to specific cells, (e.g. intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic intracellular infected cells.
                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The amino acid sequence of fragment 3 relating to position 286-295 of human hear shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HSP; HSP70; heat shock protein 70; cancer; chronic infectious disease; vaccine; HSP-peptide complex; tumour; peptidic fragment; lymphocyte; cytotoxic response; epitope; antigen presenting cell; fragment 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lymphocytes useful for treating cancer, recognizes specifically transformed human cells with induced and increased membrane expression of heat shock protein -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                           ö
presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

sequence. Human heat shock proteins are located on chromosomes 5p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSPTOMRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the human heat shock protein SHSP70 amino acid

                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of
                                                                                                                                                                                                                                                          Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; heat shock protein; HSP70; chromosome 6p21.3-22; stress; chromosome 14q22-24; transcription; rheumatism; schizophrenia; depression; nephrotic syndrome; SHSP70.

AAY88413

ò a This sequence represents the human heat shock protein SHSP70 amino acid

```
The invention relates to a novel method of identifying compounds that inhibit proliferation of cells comprising contacting a test compound with carelia which overexpresses HSP2 (heat shock protein 71), and determining if the test compound inhibits activity or expression of HSP72.

Optionally, HSP72 is contacted with the test compound under optimum conditions to allow the two components to interact and bind, forming a conditions to allow the two components to interact and bind, forming a computity of compounds that inhibit HSP72-mediated JNK phosphatase compounds the compound at the a cell which expresses HSP72, exposing the cell to a heat induced stress and determining if the compound inhibits JNK phosphatase activity. The invention additionally encompasses compositions comprising an inhibitor of HSP72 or JNK phosphatase activity. The compound stress and character activity are useful for inhibitors of HSP72 or JNK phosphatase activity are useful for inhibiting the proliferation of cells. Modulation of the activity of the
                                                                                                                                                                                                                                                                                 ö
sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human Hsp72; heat shock protein 72; chromosome 6p21.3; Hsp72 inhibitor; expression modulator; JNK phosphatase inhibitor; antiprolliferative; drug screening; cancer; leukaemia; lymphoma; solid tumour; sarcoma; carcinoma; breast cancer; prostate cancer; premalignant condition.

JNK phosphatase or Hsp72 is used to treat a proliferative disorder such as cancers (e.g., leukaemia, lymphoma, solid tumours such as sarcomas and carcinomas, breast cancer, prostate cancer). The compounds that inhibit Hsp72 activity can also be administered to treat premalignant conditions and to prevent progression to a neoplastic or malignant state. The compounds that inhibit Hsp72 function are administered to a patient having a disease or disorder mediated by an increase of Hsp72 expression or activity relative to normal levels. The present sequence represents human Hsp72 used in the exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Proteins homologous to heat shock proteins from Trypanosoma cruzi - used in vaccines and diagnosis for species of eg Mycoplasma or Mycobacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     According to the legend of Fig 2, the G. gallus HSP sequence has 635 amino acid residues, the sequence itself has only 634, including "O" (?) at position 634.

Fig. 2 provides an alignment of heat shock proteins from a variety of organisms: 1. M. hyopneumoniae (Mhyhsp70 - AAR03922);

S. Bacillus megaterium (Bmehsp70 - AAR03923);

B. coli (dnaK - AAR03924);

T. cruzi (tc70kd - AAR03924);

S. T. cruzi (tc70kd - AAR03925);

Kanopus laevis (x170 - AAR03928);

M. Momo saplens (humbsp70 - AAR03929);

Gallus gallus (chkhsp70 - AAR03930);

10. Zea mays (mzehsp70 - AAR03931);

peptide containing a CTL (cytoxic I lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the Arpase domain of a heat shock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; heat shock protein; HSP70; chromosome 6p21.3-22; stress; chromosome 14q22-24; transcription; rheumatism; schizophrenia; depression; nephrotic syndrome.
                                                               ATPase; Hsp70; heat shock protein; cytotoxic T lymphocyte; CTL; immune response; infectious disease; malaria; cytotoxic T cell; cytostatic; immunostimulant; cellular immune response inducer; protozoacide; leukaemia; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a fused protein (I) prepared
            Human heat shock protein Hsp70 protein sequence SEQ ID NO:5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human heat shock protein HSP70 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 3; Page 49-52; 72pp; Japanese

Human heat shock proteins are located on chromosomes 6p21.3-22
sequence. Human heat shock proteins are located on chromosomes 6p21.3-2: and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                  This sequence represents the human heat shock protein HSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the human heat shock protein LHSP70 amino acid

Mammalian fertilisation decrease for detecting and treating infertility - using sulpho glyco lipid immobilising protein 1-sulphated-glyco molety interfering compsn., for mycoplasma infection treatment
```

```
The likelihood of mammalian fertilisation is decreased by contacting a gamete with a sulphoglycolipid immobilising protein 1 (SLIP1)/ sulphated glyco-moiety interfering composition. The interfering compositios is e.g. the heat shock 70kD protein, SLIP1 (or analogues such as the mouse SLIP1 analogue "HSC70B" comprising the amino acid sequence AAR43002) or the 74.5kD mycoplasma protein (AAR43003).

                       the amino acid sequence of fragment 3 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP leads to a substantial concease in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSPs epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cencer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRM under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including **rheumatisms*, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                        Gaps

Human heat shock proteins are located on chromosomes 6p21.3-22 and 14922-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a novel method of identifying compounds that inhibit proliferation of cells comprising contacting a test compound with a cell which overexpresses Hsp72 (heat shock protein 72), and determining if the test compound inhibits activity or expression of Hsp72.
                                                                                                                                                                                              This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human Hsp72; heat shock protein 72; chromosome 6p21.3; Hsp72 inhibitor; expression modulator; JNK phosphatase inhibitor; antiproliferative; drug screening; cancer; leuksemia, lymphoma; solid tumour; sarcoma; carcinoma; breast cancer; prostate cancer; premalignant condition.
                                                                            Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying compounds that inhibit proliferation of cells and capable of modulating the expression of heat shock protein 72 gene and/or activity of Hsp72 useful for treating cancers such as leukemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosts of stress diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

compilarly, map: 15 contacted with the test compound under optiming a compilations to allow the two components to interact and bind, forming a complex which is detected. The invention also relates to a method of dentifying compounds that inhibit Hsp72-mediated JNK phosphatase activation. Comprising contacting a test compound with a cell which expresses Hsp72, exposing the cell to a heat induced stress and etermining if the compound inhibits JNK phosphatase activity. The invention additionally encompasses compositions comprising an inhibitor of Hsp72 or JNK phosphatase activity are useful for inhibiting the proliferation of cells. Modulation of the activity of the inhibiting the proliferation of cells. Modulation of the activity of the UNK phosphatase or Hsp72 is used to treat a proliferative disorder such as cancers (e.g., leukaemia, lymphoma, solid tumours such as sarcomas and ascancers and to preast cancer, prostate cancer). The compounds that inhibit Hsp72 function are administered to a patient compounds that inhibit Hsp72 function are administered to a patient having a disease or disorder mediated by an increase of Hsp72 expression or activity relative to normal levels. The present sequence represents human Hsp72 used in the exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteins homologous to heat shock proteins from Trypanosoma cruzi – used in vaccines and diagnosis for species of eg Mycoplasma or Mycobacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
Optionally, Hsp72 is contacted with the test compound under optimum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  According to the legend of Fig 2, the G. gallus HSP sequence has 635 amino acid residues, the sequence itself has only 634, including "O" (?) at position 634.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  According to the legend of Fig 2, the H. sapiens HSP sequence has 641 amino acid residues, the sequence itself has only 640, including "O" (?) at position 640.

Fig. 2 provides an alignment of heat shock proteins from a variety of organisms: 1. M. hyopneumoniae (Mhyhsp70 - AAR03922);
2. Bacillus megaterium (Bmehsp70 - AAR03923);
3. E. coli (dnaK - AAR03924);
4. T. cruzi (tc70kd - AAR03925);
                                                                                                                                                                                                                                                                                                                  ;

The

```
shock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (1) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the ATPase domain of a heat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer

This sequence represents the human heat shock protein LHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14422-34. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                           Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1..385 / Jabel= 44kD_ATPase_fragment

The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of FFR abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                          Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The likelihood of mammalian fertilisation is decreased by contacting a gamete with a sulphoglycolipid immobilising protein 1 (SLIP1)/ sulphated givo-molety interfering composition. The interfering composition is e.g. the heat shock 70kD protein, SLIP1 (or analogues such as the mouse SLIP1 analogue "HSC70B" comprising the amino acid sequence AAR43002) or the 74.5kD mycoplasma protein (AAR43003).

Proteins AAW54349-W54364 are examples of proteins produced in the endometrium during the hyperplasta, adenocarcinoma or proliferative phase of the endometrium. The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of cell lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the Arbase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating
                                                                                                                                                                                                                                                        Gaps

The amino acid sequence of fragment 3 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membranes Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response cancer cells. This has the effect of increasing the immune response cancer cells. HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; heat shock protein; HSP70; chromosome 6p21.3-22; stress; chromosome 14q22-24; transcription; rheumatism; schizophrenia; depression; nephrotic syndrome; SHSP70.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application

Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the human heat shock protein SHSP70 amino acid
                                                                                                                                                                                                                                                                                                                Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application

                                                                                                                                                                                                                                                                                                          This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human Hsp72; heat shock protein 72; chromosome 6p21.3; Hsp72 inhibitor;
                                                                                                                        Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying compounds that inhibit proliferation of cells and capable of modulating the expression of heat shock protein 72 gene and/or activity of Hsp72 useful for treating cancers such as leukemia,

Optionally, Hsp72 is contacted with the test compound under optimum conditions to allow the two components to interact and bind, forming a complex which is detected. The invention also relates to a method of identifying compounds that inhibit Hsp72-mediated JNK phosphatase activation, comprising contacting a test compound with a cell which expresses Hsp72, exposing the cell to a heat induced stress and determining if the compound inhibits JNK phosphatase activity. The compounds is identified as invention additionally encompasses compositions comprising an inhibitor of Hsp72 or JNK phosphatase activity. The compounds identified as inhibitions of Hsp72 or JNK phosphatase activity are useful for inhibiting the proliferation of cells. Modulation of the activity of the as cancers (e.g., leukaemia, lymphoma, solid tumours such as sarcomas and carcinomas, breast cancer, prostate cancer). The compounds that inhibit Hsp72 function are administered to a patient compounds that inhibit Hsp72 function are administered to a patient or arrivity relative to a disorder mediated by an increase of Hsp72 expression or arrivity and activity or a patient or arrivity relative to an increase of Hsp72 expression or arrivity and activity or a patient or arrivity relative to an increase of Hsp72 expression or arrivity or a patient or arrivity or allored to a patient or arrivity or arrivity or allored to a patient or arrivity or arrivity or allored to a patient or arrivity or arrivity or an arrivity or arrivity or arrivity or arrivity or arrivity or arrivity or allored to a patient or arrivity or arrivi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Proteins homologous to heat shock proteins from Trypanosoma cruzi - used in vaccines and diagnosis for species of eg Mycoplasma or Mycobacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or activity relative to normal levels. The present sequence represents human Hsp72 used in the exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "residue given as "O" in specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hsp70; heat shock protein; Trypanosoma cruzi; vaccines; HSP.

represent invention describes a larged protein (1) prepresent invention of a protein containing and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence regerosciel is a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a fused protein (I) prepared from a

```
This sequence represents the human heat shock protein LHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                            Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "peptides comprising an intact domain from the APPase fragment of hap70 are claimed; the peptides are homologous to sequences conserved between SLIP1 and 74.5kD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sulphoglycolipid immobilising protein 1; sperm plasma membrane;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the human heat shock protein HSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                           Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The likelihood of mammalian fertilisation is decreased by contacting a gamete with a sulphoglycolipid immobilising protein 1 (SLIP1)/ sulphated glyco-molety interfering composition. The interfering composition is e.g. the heat shock 70kD protein, SLIP1 (or analogues such as the mouse SLIP1 analogue "HSC70B" comprising the amino acid sequence AAR43002) or the 74.5kD mycoplasma protein (AAR43003).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Endometrium; hyperplasia; adenocarcinoma; proliferative phase;
                                                                                                                                             Mammalian fertilisation decrease for detecting and treating infertility - using sulpho glyco lipid immobilising protein 1-sulphated-glyco molety interfering compsn., for mycoplasma

Proteins AAW54349-W54364 are examples of proteins produced in the endometrium during the hyperplasia, adenocarcinoma or proliferative phase of the endometrium. The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of cell lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the Afpase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (1) has cytostaic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer -

This peptide corresponds to amino acid residues 286-295 of the human heat shock protein 70 (hsp70). The invention relates to a method of identifying peptides, derived from hsp70 that stimulate a tumour-specific confunction of a tensor of the hsp70 peptides that have at least confunction or alteration compared with the native sequence, and induce concorred to more tumours; (ii) amplifying hsp70 confunction or more tumours; (ii) cloning the amplified concorred into a vector that can be replicated in bacteria; (iii) sequences into a vector that can be replicated in bacteria; (iii) sequences into a vector that can be replicated in bacteria; (iii) sequences into a vector that can be replicated in bacteria; (iii) sequences into a vector that can be replicated in bacteria; (iii) sequencing fragments in each cultured bacterial colony to identify of the mutant peptides identified. The peptides, optionally formulated with an each particularly solid cancers (carcinoma, sarcoma, melanoma, neuroblastoma, particularly solid cancers (carcinoma, sarcoma, melanoma, neuroblastoma, also be used to increase the proportion of tumour specific cytotoxic factors (specifically interleukin-2, interferon-gamma and cytotoxic factors (specifically interleukin-2, interferon-gamma and cytotoxic factors (specifically where the cells are used to immunogenicity and high specificity for particular HLA (human leucocyte antimum) alledes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HSP; HSP70; heat shock protein 70; cancer; chronic infectious disease; vaccine; HSP-peptide complex; tumour; peptidic fragment; lymphocyte; cytotoxic response; epitope; antigen presenting cell; fragment 2.

to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSPs and HSP pericels presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The amino acid sequence of fragment 3 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the periceilular membrane. Recognition of increased numbers of HSP epitopes on cell, periceilular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HSP; HSP70; heat shock protein 70; cancer; chronic infectious disease; vaccine; HSP-peptide complex; tumour; peptidic fragment; lymphocyte; cytotoxic response; epitope; antigen presenting cell; fragment 3.

presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14g22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application

sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP7OmRNA under acute and chronic stress load in a human. The abnormal transcription of HSP7O can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the human heat shock protein SHSP70 amino acid

This sequence represents the human heat shock protein SHSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 1462-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                   Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application

Abnormal transcription of intracellular HSP70mRNA under acute and chronic continuous load of stress in a human being and its application

This sequence represents the human heat shock protein SHSP70 amino acid Disclosure; Fig 6; 11pp; Japanese.

ö sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14922-24. The invention relates to the abnormal transcription of intracellular HSP70mRA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome. Identifying compounds that inhibit proliferation of cells and capable of modulating the expression of heat shock protein 72 gene and/or activity of Hsp72 useful for treating cancers such as leukemia, 1 ymphoma

Examples; Fig 16B; 77pp; English.

The invention relates to a novel method of identifying compounds that inhibit prollferation of cells comprising contacting a test compound with a cell.which overexpresses Hsp72 (heat shock protein 72), and determining if the test compound inhibits activity or expression of Hsp72.

Optionally, Hsp72 is contacted with the test compound under optimum conditions to allow the two components to interact and bind, forming a complex which is detected. The invention also relates to a method of identifying compounds that inhibit Hsp72-mediated JNR phosphatase activation, comprising contacting a test compound with a cell which expresses Hsp72, exposing the cell to a heat induced stress and determining if the compound inhibits JNR phosphatase activity. The compound all pencengasses compositions comprising an inhibitor of Hsp72 or JNR phosphatase activity are useful for inhibiting the proliferation of cells. Modulation of the activity of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         According to the legend of Fig 2, the H. sapiens HSP sequence has 641 amino acid residues, the sequence itself has only 640, cincluding "O" (?) at position 640.

Erg. 2 provides an alignment of heat shock proteins from a variety of organisms: 1. M. hyopneumoniae (Mhyhsp70 - AAR03922);

C. Bacillus megaterium (Bmehsp70 - AAR03923);

B. coli (dnaK - AAR03924);

C. T. cruzi (LC70kd - AAR03927);

S. T. cruzi (AAR03926);

C. Rat rattus (rathsp70 - AAR03927);

Xenopus laevis (x170 - AAR03928);

C. Hondon sapiens (humbsp70 - AAR03930);

G. Gallus gallus (chkhsp70 - AAR03930);

C. Lea mays (mzehsp70 - AAR03931);

The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (1) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response protozoacide activities, and can be used as a cellular immune response compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                 Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer

sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "peptides comprising an intact domain from

                                                                                                                                                                                                                                                                                         This sequence represents the human heat shock protein HSP70 amino acid sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.

ò g Mammalian fertilisation decrease for detecting and treating PT infertility - using sulpho glyco libid immobilising protein 1-sulphated-glyco moiety interfering compsn., for mycoplasma pr infection treatment

XX

Claim 2 and Clalim 17; Page 60-62; 77pp; English.

XX

CR

The likelihood of mammalian fertilisation is decreased by contacting companies with a sulphoglycolipid immobilising protein 1 (SLIP1)/

CC

Sulphated glyco-moiety interfering composition. The interfering compsn. is e.g. the heat shock 70kD protein, SLIP1 (or analogues CC

Such as the mouse SLIP1 analogue "HSC70B" comprising the amino acid composition and composition or the 74.5kD mycoplasma protein (AAR43003).

Identifying mutant peptides from heat-shock protein 70, for treatment of cancer

```
This peptide corresponds to amino acid residues 286-295 of the human care shock protein 70 (hsp70). The invention relates to a method of clear shock protein 70 (hsp70). The invention relates to a method of identifying peptides, derived from hsp70 that stimulate a tumour-specific T cell response. Identification of the hsp70 peptides that have at least one mutation or alteration compared with the native sequence, and induce a tumour-specific T-cell response, comprises: (i) amplifying hsp70 compared to more tumours; (ii) cloning the amplifying hsp70 compared to more tumours of colony to identify sequencing fragments in each cultured bacterial colony to identify any hsp70 mutant peptides identified. The peptides, optionally formulated with an agent that induces cellular stress, are used for treatment of cancer, particularly solid cancers (carcinoma, sarcoma, melanoma, neuroblastoma, cancers of head and neck, particularly kidney cancer). The peptides may also be used to increase the proportion of tumour-specific cytotoxic corrects (carcinoma, neuropeacific cytotoxic cancers (secrete cytotoxic factors), particularly where the cells are used to through the colls are used to stimulate immune defences. The method identifies peptides with high companients and high specifically for particular HLA (human leucocyte).

The amino acid sequence of fragment 2 relating to position 286-295 of

Claim 8; Page 15; 21pp; English.

```
human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSP and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The amino acid sequence of fragment 3 relating to position 286-295 of human heat shock protein 70 (HSP70) is given. The new invention relates to lymphocytes which recognise cells of a patient in which overexpression of HSP has been induced. Overexpression of HSP leads to a substantial increase in the numbers of HSPs and HSP epitopes presented on the pericellular membrane. Recognition of increased numbers of HSP epitopes on cell pericellular membranes by lymphocytes elicits a cytotoxic response which kills the target cells. As a further embodiment of the invention, HSP70 epitopes are mutated prior to being loaded into antigen

                                                                             ţ
presenting cells. This has the effect of increasing the immune response to HSP and helps direct the immune response to specific cells, (e.g. cancer cells). HSP70 fragments are useful for treating cancer or intracellular infections by vaccination. The tolerance of the organism to the tumour or to the virus associated HSP is broken using an immunogenic mutated form of HSP and induction of a stress on the target tumoural or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the human heat shock protein SHSP70 amino acid agequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14922-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application

sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the human heat shock protein SHSP70 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the human heat shock protein SHSP70 amino acid agequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14922-24. The invention relates to the abnormal transcription of first and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rhemantisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the human heat shock protein SHSP70 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application
                                                                                                                                                                                                                                                 Abnormal transcription of intracellular {\tt HSP70mRNA} under acute and chronic continuous load of stress in a human being and its application

The invention relates to a novel method of identifying compounds that inhibit proliferation of cells comprising contacting a test compound with a cell which overexpresses Hsp72 (heat shock protein 72), and determining if the test compound inhibits activity or expression of Hsp72.

Coptionally, Hsp72 is contacted with the test compound under optimum conditions to allow the two components to interact and bind, forming a conditions to allow the two components to interact and bind, forming a conditions to allow the two components to interact and bind, forming a condition of method of identifying compounds that inhibit Hsp72-mediated JNK phosphatase corresses Hsp72, exposing the cell to a heat induced stress and determining if the compound inhibits JNK phosphatase activity. The invention additionally encompasses compositions comprising an inhibitor of Hsp72 or JNK phosphatase activity are useful for inhibiting the proliferation of cells. Modulation of the activity of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRN under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human Hsp72; heat shock protein 72; chromosome 6p21.3; Hsp72 inhibitor; expression modulator; JNK phosphatase inhibitor; antiproliferative; drug screening; cancer; leukaemia; lymphoma; solid tumour; sarcoma; carcinoma; breast cancer; prostate cancer; premalignant condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying compounds that inhibit proliferation of cells and capable of modulating the expression of heat shock protein 72 gene and/or activity of Hsp72 useful for treating cancers such as leukemia,

JNK phosphatase or Hsp72 is used to treat a proliferative disorder such as cancers (e.g., leukaemia, lymphoma, solid tumours such as sarcomas and carcinomas, breast cancer, prostete cancer). The compounds that inhibit Hsp72 activity can also be administered to treat premalignant conditions and to prevent progression to a neoplastic or malignant state. The compounds that inhibit Hsp72 function are administered to a patient having a disease or disorder mediated by an increase of Hsp72 expression or activity relative to normal levels. The present sequence represents human Hsp72 used in the exemplifications of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Proteins homologous to heat shock proteins from Trypanosoma cruzi - used in vaccines and diagnosis for species of eg Mycoplasma or Mycobacteria.
                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fig. 2 provides an alignment of heat shock proteins from a variety of organisms: 1. M.hyopneumoniae (Mhyhsp70 - AAR03922);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        According to the legend of Fig 2, the G. gallus HSP sequence has 635 amino acid residues, the sequence itself has only 634, including "O" (?) at position 634.
                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "residue given as "O" in specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       M.hyopneumoniae (Mhyhsp70 - AAR03922);

intracellular; abnormal transcription; acute; chronic; sustained;
                                                                                                                                                                                                                                                                                                                                                         The cDNA encoding the present sequence, human heat shock protein (HSP70), is located on human chromosome 6p 21.3-22 and 14q 22-24 and 21. Primers and probes based on the HSP70 cDNA coding sequence can be used to detect the abnormal transcription of intracellular HSP70 mRNA in human acute and chronic sustained stress load.

The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (I) containing the INA of (2); and (4) a transformant which can retain the protozoacide activities, and can be used as a cellular immune response protozoacide activities, and can be used as a cellular immune response compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a specifically claimed heat shock protein for use in a fused protein of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                               sequence. Human heat shock proteins are located on chromosomes 6p21.3-22 and 14q22-24. The invention relates to the abnormal transcription of intracellular HSP70mRNA under acute and chronic stress load in a human. The abnormal transcription of HSP70 can be used in the improvement of stress and response and diagnosis of stress diseases including rheumatisms, schizophrenia, depression and nephrotic syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human heat shock protein LHSP70 amino acid
                                                                                                                                                                                                                   Abnormal transcription of intracellular HSP7OmRNA under acute and chronic continuous load of stress in a human being and its application
